High sensitivity C- Reactive Protein (hsCRP) significantly improves cardiovascular risk assessment as it is a strongest predictor of future coronary events. It reveals the risk of future Myocardial infarction and Stroke among healthy men and women, independent of traditional risk factors. It identifies patients at risk of first Myocardial infarction even with low to moderate lipid levels. The risk of recurrent cardiovascular events also correlates well with hs CRP levels.

Note:
To assess vascular risk, it is recommended to test hsCRP levels 2 or more weeks apart and calculate the average
