DEPARTMENT OF MOLECULAR DIAGNOSTICS

Acute Lymphoblastic Leukemia Translocation Panel

Acute Lymphoblastic Leukemia Translocation Panel (Qualitative) Multiplex RT-PCR & Gel Electrophoresis

Specimen type: EDTA P. (B)

TRANSLOCATION	STATUS OF TRANSLOCATION
t(9;22)(q34,q11)	Not detected
t(12;21)(p13,q22)	Not detected
t(1;19)(q23,p13)	Not detected
t(4;11)(q21,q23)	Not detected

Result:

The hybrid transcripts for *BCR/ABL1*, *ETV6/RUNX1*, *E2A/PBX1* and *MLL/AF4* were not detected in the leukocytes of the specimen.

Interpretation:

This multiplex RT-PCR assay addresses interrogation of the translocation status of the four major gene translocations of importance in Acute Lymphoblastic Leukemia. The analytical sensitivity of the assay ranges from 10^{-3} to 10^{-4} for each of the translocations studied. The *BCR/ABL1* gene translocation, or t(9;22)(q34,q11) is found in more than 95% patients of CML, 5% patients of pediatric and 15-30% patients of adult B-ALLs. Detection of *BCR/ABL1* transcript establishes the diagnosis of CML, and denotes an unfavorable prognosis in ALL. This Test detects the Major (M-BCR) and Minor (m-BCR) breakpoint forms corresponding to p210 and p190kDa protein respectively. The *ETV6/RUNX1* gene translocation, or t(12;21)(p13,q22) has been reported in 20-25% patients of pediatric pre-B-ALL in the Caucasian race and 5-10% patients of pediatric pre-ALL-B in the Indian population. The presence of this translocation is an indicator of favorable prognosis and longer DFS. The *E2A/PBX1* gene translocation, or t(1;19)(q23,p13) has been reported in 3-4% of ALL patients and upto 20-25% patients of pediatric pre-B-ALL. The presence of the translocation is an indicator of unfavorable prognosis. The *MLL/AF4* gene translocation, or t(4;11)(q21,q23) has been reported in 3-8% of pediatric and adult ALL patients. The presence of the translocation is an indicator of unfavorable prognosis.

Test Attributes and Limitations:

The analytical sensitivity of the assay ranges from 10^{-3} to 10^{-4} for each of the translocations studied. Samples must be received at the laboratory under appropriate conditions within 48hrs of aspiration to ensure preservation of RNA. PCR is a highly sensitive technique; reasons for apparently contradictory results may be due to improper quality control during sample collection, selection of inappropriate specimen and/or presence of PCR inhibitors.

Note: This Test has been developed and its performance evaluated at Oncquest Laboratories Ltd.
